Sanin, N. A. On subsets of a natural sequence of numbers having density. Mat. Sbornik N.S. 31(73), 367-380 (1952). (Russian)

By the density of a subset A of integers one understands the limit, if it exists, of $\Gamma(A, n)/n$ (as $n \rightarrow \infty$), where $\Gamma(A, n)$ denotes the number of elements of A among the first n -integers. Although sets having density (α -sets) do not even form a field the author tries to construct a theory of α sets which would exhibit similarity to the usual theory of Lebesgue measurable sets. In order to state at least one of the results the following terminology is needed: (a) One says that A is "almost contained" in B ($A \subset B$) if $A - B$ (in the usual point-set theoretic sense) has density 0. (b) A set H is called an "upper limit set" of a collective \mathfrak{M} of α sets if H is an α set and each element of \mathfrak{M} is almost contained in H . One then defines a "minimal upper limit set" in the usual way. The author then proves the following: If $\{D_i\}$ is an ascending sequence of α sets, there exists a set H which is the minimal upper limit set of the collection $\{D_i\}$ and $\alpha(H) = \lim_{i \rightarrow \infty} \alpha(D_i)$. Here $\alpha(\cdot)$ denotes the density of the set in parentheses. A variety of other results is given but it is difficult to reproduce them without further specialized terminology.

Šanin, N. A. On some operations on logico-arithmetic formulas. Doklady Akad. Nauk SSSR (N.S.) 93, 779-782 (1953). (Russian)

This is related to recent work on realizability, constructible falsity, etc., by S. C. Kleene and D. Nelson [see, e.g., Kleene, Introduction to metamathematics, Van Nostrand, New York, 1952, pp. 501 ff.; these Rev. 14, 525]. The author characterizes two operations Δ and ∇ by inductive specifications of which the following are typical clauses:

$$\begin{aligned}\Delta(T=S) &= T=S, & \nabla(T=S) &= (T=S) \\ \Delta(P\&Q) &= \Delta P \& \Delta Q, & \nabla(P\&Q) &= \nabla P \vee \nabla Q \\ \Delta(P \Rightarrow Q) &= \nabla P \vee \Delta Q, & \nabla(P \Rightarrow Q) &= \Delta P \& \nabla Q \\ \Delta(\forall xP) &= \forall x(\Delta P), & \nabla(\forall xP) &= (\exists x)\nabla P\end{aligned}$$

where T and S are terms, P and Q are formulas, and '=' indicates identity by definition. He states various theorems concerning these operations; typical of these is the statement that $\Delta R \supset R$, $\nabla R \supset \neg R$ hold in the intuitionistic calculus, while the converses hold in the classical calculus but are not realizable.

ŠANIN, N. A.

Šanin, N. A. On imbeddings of the classical logico-arithmetical calculus into the constructive logico-arithmetical calculus. Doklady Akad. Nauk SSSR (N.S.) 94, 193-196 (1954). (Russian)

This is a continuation of a previous paper by the same author [same Doklady (N.S.) 93, 779-782 (1953); these Rev. 15, 593]. The subject is mappings of the predicate calculus with arithmetic which carry true formulas of the classical calculus into true formulas of the intuitionistic calculus. Such mappings have been constructed by Kolmogorov and Gödel. If α (i.e. the mapping $p \rightarrow p$) is such a mapping, the author calls α regular if and only if the formula $\alpha p \supset p$ is valid in the intuitionistic calculus. The author gives some examples of regular mappings, and states their relationships to one another and to the irregular mappings of Kolmogorov and Gödel.

★ Шанин, Н.А. [Shanin, N. A.] О некоторых логических проблемах арифметики. [On some logical problems of arithmetic.] Труды Mat. Inst. im. Steklov. no. 43. Izdat. Akad. Nauk SSSR, Moscow, 1955. 112 pp. 5.20 rubles.

This work is concerned with mapping from a classical "logico-arithmetic system" into a constructive (intuitionist) one. [For an abstract see Dokl. Akad. Nauk SSSR (N.S.) 93 (1953), 779-782; MR 15, 593; also Mostowski, J. Symb. Logic 19 (1954), 297-298.] Here a logico-arithmetic system is an applied predicate calculus with individual variables ranging over natural numbers; one basic predicate, equality, is allowed, and no propositional or predicate variables; there is a constant 0, and the successor, sum, and product functions; and the axioms, besides those derived from the schemes of the logical calculus, express the Peano postulates, the properties of equality, and the recursive definitions of the sum and product. Reference is made to the work of Kleene and Nelson on recursive realizability [see § 82 of Kleene's book, Introduction to metamathematics, Van Nostrand, New York, 1952; MR 14, 525]. The author's constructive

Sarin, N. A.

system Σ is very similar to that of Kleene and Nelson; the classical system Σ^+ is obtained by adding all instances of the law of excluded middle. About half of the book is devoted to an exposition of fundamentals which is of some interest from the standpoint of philosophy of formal methods. The last two chapters are devoted to the study of embedding (pogružajušcie; literally "immersing") operators α , where α maps any formula P into an image αP such that, if P is valid in Σ^+ , αP is valid in Σ , and from a proof of αP in Σ one can find a proof of P in Σ^+ (usually because P and αP are equivalent in Σ^+). This subject is the same as §81 of Kleene (loc. cit.); but several operations not treated there are considered here (and vice-versa in a few cases). A chapter is devoted to regular embedding operators, i.e. those such that $P \supset \alpha P$ is recursively realizable (and, in all cases considered, derivable in Σ). The operators of Kolmogoroff, Gödel, etc. did not have this property. Several examples of such transformations are considered; some simple ones make considerable disturbances in P , while others which are more complex, make less disturbances. The interrelations between these are investigated, and full proofs are given. H.-B. Curry.

AUTHOR: Shanin, N. A.

TITLE: The constructive understanding of key formulas. Part I

SOURCE: AN SSSR. Matematicheskiy institut. Trudy, v. 72, 1964. Problemy konstruktivnogo napravleniya v matematike; sbornik rabot (Problems of constructive direction in mathematics), no. 3, 348-379

TOPIC TAGS: constructive formalism, operative logic, semantics, key formula, K algorithm, canonical calculus, L calculus

ABSTRACT: This is essentially a continuation of an earlier paper by the same author (Trudy Matem. inst. im. V. A. Steklova, LII, 226-311, 1958) which contained the definition of the "Key formula". (The author insists that some of the results of this earlier paper were misunderstood by A. Heyting, who reported on the paper in Math. Rev. 21, no. 1, 1960, pp 1-2.) The present paper was prompted by the discovery that the semantics of operative logic as proposed by Lorenzen (Einführung in die operative Logik und Mathematik, Berlin, Springer-Verlag, 1955) cannot yield a constructive interpretation of the normal key formulas. Consequently, in this first part of the work, the author formulates a special logico-mathematical

2

language - the language of the primary λ formulas - which is particularly suitable for the above-mentioned purposes, and in connection with a fixed starting calculus he formulates a definite interpretation of these primary λ -formulas whose rank does not exceed two. The interpretation of higher-order λ -formulas will constitute the subject of the second part of the work, which will also discuss the representation of arbitrary key formulas. While, in the first paper, the author utilized the normal algorithm approach, in the present paper his interpretation of the normal key formulas is based on the second exact algorithm concept in the given alphabet - the so-called K-algorithm. A generalization of E. L. Post's calculus (Amer. Journ. of Mathem., 65, no. 2, 197-215, 1943) is also given. "The author is indebted to the participants in the Leningrad seminar on mathematical logic and constructive mathematics, and particularly to S. Yu. Maslov, for discussions of the work and for important remarks." Orig. art. han: 129 formulas.

AUTHOR: Shanin, N. P.

TITLE: The determination of the extrusion-rheological properties of plastics by means of pressing through a ring slot

PERIODICAL: Plasticheskiye massy, no. 5, 1962, 62 - 63

TEXT: An improved extrusion head (Fig.) is proposed which permits determining the pressure gradient along a ring-slot channel with a steady flow of plastic. It is shown that the viscosity μ_1 and the rheological constant n of plastics can be determined from measurements of the volume delivery and of the pressure drop. The outer diameter of the ring slot in the suggested device is 50 mm, the inner diameter is 28 mm, and $l = 70$ mm. μ_1 reaches up to $10^5 \text{ dyn} \cdot \text{sec}^{1/n} \cdot \text{cm}^2$ in the range of the pressing velocity gradient of from $8.3 \cdot 10^{-1} \text{ sec}^{-1}$ to $1.75 \cdot 10^2 \text{ sec}^{-1}$. There is 1 figure. X

TITLE: New method of determining the rheological constants of polymer melts

SOURCE: Plasticheskiye massy, no. 11, 1964, 49-51

TOPIC TAGS: polymer, solid mechanical property

ABSTRACT: An expression is derived for the dependence of the time of extrusion of a polymer melt through a cylindrical channel with known radius and length at constant temperature (i.e., constant rheological constants), on the pressure. An instrument (extruding rheometer) was designed for determining the rheological constant of the material by comparing the time of extrusion of a portion of the material of the same volume through a channel of constant dimensions under the action of two known but differing pressures. The results obtained according to a graph constructed for a concrete value of the instrument constant were in good agreement with the experimental data.

Abstract: During the summer of 1954 on the Voroshilov kolkhoz of the Rostov district in the Yaroslav oblast, a determination of seed productivity of meadow grasses by natural and seeded meadows was conducted. The average yield of seeds by meadow timothy on a natural meadow was ~ 140 kg/hectares, but on a seeded one ~ 277 centners/hectare [pic]. On natural meadows Bekmania yielded up to 198, white bent grass up to 60 and foxtail up to 150 kg/hectare of seeds.

✓ Influence of aminazine on certain functions of central nervous system. I. I. Baryshnikov, V. M. Vinogradov, M. I. Nikiforov, and Yu. N. Shanin. *Zhur. Vysshel. Nervnoj Deyatel'nosti im. I. P. Pavlova*, 6, 881-90 (1956).

Synonyms for aminazine are: megaphen; chlorpromazine, 4560 RP, torazin, largactil, and SKF-2601-A. Administration of 3-5 mg./kg. of aminazine leads to lowered electric activity of the brain. After the first dose of 0.5-1.5 mg./kg. of aminazine there is a decrease in conditioned reflex activity. Strychnine in doses of 50 γ/kg. restores the reflex activity which was inhibited by aminazine. ACCESSION NR: AP4041691

S/0181/64/006/007/1946/1955

AUTHORS: Zevin, V. Ya.; Shanina, B. D.

TITLE: On the theory of paramagnetic resonance in zero and intermediate magnetic fields

SOURCE: Fizika tverdogo tela, v. .6, no. 7, 1964, 1946-1955

TOPIC TAGS: electron paramagnetic resonance, energy level, eigenvector, spin, wave function dipole transition, hyperfine structure

ABSTRACT: In order to help identify the additional EPR lines that appear in zero and in intermediate magnetic fields, the authors calculate the energy levels, the eigenvectors, the spin wave functions, and the magnetic-dipole transitions for two interacting spins in the presence of axial symmetry, for the case when one of the spins is equal to $1/2$ and the other spin is arbitrary. A detailed analysis is made of the probability of zero-field transitions between levels

Card 1/2

ACCESSION NR: AP4041691

of the hyperfine structure of a paramagnetic center in view of the interest that attaches to field-free resonance in the region below microwave frequency. Expressions for the energy levels and for the spin wave functions are also obtained for the case when the smaller of the spins is equal to unity. The small perturbations that bring about super-hfs splitting are briefly discussed. The results can be useful not only in investigations of field-free resonance at the hyperfine structure, but in calculations of the magnetic susceptibility and analysis of exchange interaction between paramagnetic centers. "The authors are grateful to Professor M. F. Deygen for reviewing the manuscript." Orig. art. has: 3 figures and 20 formulas.

SHANINA, L. T., CAND CHEM SCI, "ACTION OF ADSORPTION OF
ANION HALIDES ^{ON THE PROCESS OF IONIZATION OF HYDROGEN ON}
PLATINUM AND PALLADIUM." ALMA-ATA, 1960. (KAZAKH STATE
UNIV IM S. M. KIROV). (KL, 3-61, 201).

81871

Effect of the Adsorption of Anions on the Process S/020/60/133/02/47/068
of the Discharge of Hydrogen Ions on Palladium and B004/B064
the Ionization of Hydrogen Dissolved in Palladium

differ from that made with 1 N H_2SO_4 , Br^- and particularly I^- cause a disturbance of the reversibility of the process by forming a hysteresis loop (Fig. 1). Special tests showed that the amount of hydrogen adsorbed by Pd does not decrease in the presence of I^- . However, additional I^- ions are adsorbed. Measurements as to the dependence of the Pd electrode potential on the amount of the current passed through 0.005 N KI + 1 N H_2SO_4

(Fig. 2) also showed an incongruity of the curves if these measurements are started at a high or low current density. Furthermore, they showed a linear dependence of the deviation of the potential on the logarithm of the current density. As is shown in Fig. 3 the effect of the I^- ions is considerably less in alkaline solutions. At a transition from acid to alkaline solutions the power of adsorption of the I^- ions decreases. The author expresses his thanks to A. N. Frumkin, Academician, for the subject of the paper and for the interest he took in it. There are 3 figures and 7 Soviet references. *W*

TITLE: The Corrosion of Iron in Sea Water (O korrozii chuguna v morskoy
vode)

PERIODICAL: Tr. Azerb. n.-i. in-t po dobuche nefti, 1955, Nr 2, pp 414-419

ABSTRACT: Results are presented of tests of several grades of iron (I) subjected to the action of sea water (Caspian) for the purpose of checking their corrosion strength. In all 11 samples were tested. Corrosion strength is determined by difference in weight before and after the experiment. The experiments are conducted with total immersion in sea water and in the splash zone above the water. The following conclusions are drawn from the tests: Austenitic I of the Ni-resist type shows the highest corrosion strength (13-14 times as high as that of steel); followed by 0.41% Ni I, having 5 times the corrosion strength of steel. Next comes I with small additions of Cu and Al which is 2-3 times as resistant as steel. Inoculated I is 50% more corrosion-resistant in sea water than steel. On total immersion in sea water, ordinary gray I displays the same corrosion resistance as carbon steel.
